

ThinManager Mirrored Redundancy Licensing EOL

ThinManager will only support full redundancy licensing as of February 25, 2019

There are two types of ThinManager Redundancy:
Mirrored and Full

Redundancy is defined as having 2 separate installs of ThinManager whose configuration databases are automatically synchronized so that either install can deliver the ThinManager firmware and configuration to a ThinManager-managed terminal.

Full Redundancy is a 100% up charge from No Redundancy and allows configuration changes to be made from either the Primary ThinManager install or the Secondary.

Mirrored Redundancy is a 50% up charge from No Redundancy but only allows configuration changes to be made from the Primary ThinManager install.

ThinManager Mirrored Redundancy is End of Life (EOL) Feb. 24

The Mirrored Redundancy catalog numbers have been flagged as End of Life (EOL)

They will be orderable through Feb 24, 2019. Starting Feb 25, 2019, the existing Full Redundancy catalog numbers should be used as the replacement.

The change to offer a single redundancy offering will simplify commercial messaging and better align ThinManager with other redundancy offerings in the portfolio.

Existing Mirrored Redundancy customers that purchase a new Full Redundancy license will receive a free upgrade to Full Redundancy for all of their existing Mirrored Redundancy licenses.
