Windows 2008 Server

Adding Terminal Server Role

Windows 2008 Server, like Windows 2003 Server, allows two RDP connections for administrative purposes. To make the Windows 2008 Server a terminal server where many people can access applications requires adding the Terminal Services Role.

Open the Server Manager window.

![Server Manager Window](image)

Highlight Roles in the tree and select Add Roles in the right pane. A wizard will launch allowing you to add Terminal Services as a role.

Highlights of the Role Wizard include:
The **Role Wizard** lists a dozen roles that are available.

Check the **Terminal Services** checkbox and any other roles desired.

Select **Next** to continue.
Terminal Services has several options:

- **Terminal Server** – the basic terminal services option. Check this option
- **TS Licensing** – This makes the server a 2008 License Server. You need a 2008 License Server and 2008 Terminal Services Client Access Licenses (TS CALs) to operate. Select this if this server will be your Terminal Services License Server.

Select **Next** to continue.
Windows 2008 TS CALs, like Windows 2003 TS CALs, are available as **Per Device** or **Per User**.

The terminal server should match the mode that the license server is using.

Select **Next** to continue.
The **Add Roles Wizard** will end with a list of the configurations that will be installed. Select **Install** to add the role(s). Once the wizard is finished it will assume the role of a terminal server.
Adding Applications in Windows 2008

Applications on terminal servers need to be installed in the Install Mode. Open the Control Panel and click on the Install Application on Terminal Server icon to start the installation wizard.

A wizard will run that allows the installation of the application.

The Install Mode can also be entered by typing `change user /install` at a command prompt. You can then run the `setup.exe` to install your application.

Type `change user /execute` when finished installing to leave the Install Mode.

Create Users

Users management is located in the Server Manager console.
Users need to be members of the **Remote Desktop Users** group to access the terminal server.

### Allowing Application Access

Applications installed on a terminal server are not available to remote users unless the Terminal Server Settings are changed to allow access to the applications. You can either allow access to all applications or allow access to specific applications in the **TS RemoteApp Manager**.

**Allowing Application Access – All Applications**

Applications installed on a terminal server are not available to remote users unless the Terminal Server Settings are changed to allow access to the applications.

You can change the settings to allow access to all installed applications in the **TS RemoteApp Manager**.

![TS RemoteApp Manager](image)

Highlight **TS RemoteApp Manager** under the **Terminal Services** branch of the **Server Manager** tree.

Select the **Change** link for the **Terminal Server Settings** to launch the **RemoteApp Deployment Settings** page.
Select the Terminal Server tab of the **RemoteApp Deployment Settings** page.

Select the *Allow users to start both listed and unlisted programs on initial connection* radio button in the **Access to unlisted programs** section.

This will allow any program to be run by an authorized user.

You can also select and define specific applications that can be run by configuring them in the **TS RemoteApp Manager**.
Allowing Application Access – Specific Applications

You can control application access on Windows 2008 Server by only allowing access to specific applications.

Highlight **TS RemoteApp Manager** under the **Terminal Services** branch of the **Server Manager** tree.

Select the **Add RemoteApp Programs** link in the **Actions** column on the right of the screen to launch the RemoteApp Wizard.
The **RemoteApp Wizard** shows a list of applications installed on the Windows 2008 Server.

Select the checkbox for each application that you want available for deployment as a ThinManager Display Client.

Select **Next** to complete the wizard. A remote user can run any checked application.

**Installing ThinManager**

It is a common practice to install ThinManager on a terminal server but ThinManager is independent of terminal services and doesn’t need to be installed on a terminal server.

Applications on terminal servers need to be installed in the **Install Mode**. Open the Control Panel and click on the **Install Application on Terminal Server** icon to start the installation wizard.
Once the wizard begins navigate to the ThinManager setup.exe program and continue with the wizard. See Installation of ThinManager for details.

The Install Mode can also be entered by typing `change user /install` at a command prompt. You can then run the `setup.exe` to install ThinManager.

Type `change user /execute` when finished installing to leave the Install Mode.
Allow Inbound Traffic to Firewall

ThinManager requires communications to the ThinManager Ready thin clients. This communication is blocked by default in the firewall and needs to be allowed.

You can either open the firewall to all traffic or open the specific ports needed.

Allow All Inbound Traffic

You can configure the firewall by selecting Windows Firewall with Advanced Security in the Server Manager tree.

Highlight Windows Firewall with Advanced Security in the Server Manager tree. Right click and select Properties to launch the Properties window.
Select the profile tab that matches the type of network you are using, **Domain**, **Private**, or **Public** profile. Change the **Inbound connections** to **Allow** and select **OK** to accept the change. This will allow the thin clients to connect to ThinManager through the firewall.
Open Ports in Firewall

You can open specific ports in the Windows 2008 Server firewall instead of allowing all inbound connections if you prefer.

Open the **Local Security Policy** by selecting the **Start > Administrative Tools > Local Security Policy**.

![Local Security Policy](image)

Expand the **Windows Firewall with Advanced Security** to show the **Inbound Rules**.

Right click on the **Inbound Rules** and select **New Rule**. A wizard will launch that allows configuration of a new port.

You need to run the wizard twice, once to allow **UDP 4900** and once to allow **TCP 2031**.
Select **Port** as the rule you are configuring and select **Next** to continue.
You will need to select the protocol and port for each rule. You will need to run the wizard once for UDP 4900 and once for TCP 2031.

Select the protocol and enter the port as shown in Rule Wizard – Protocols and Ports.

Select **Next** to continue.
Select **Allow the Connection**.

Select **Next** to continue.
Select the network(s) that the rule will apply to.

Select *Next* to continue.

A **Name** page will allow you to name the rule and add a description for management and organizational purposes.

Select **Finish** to save and apply the rule.
Repeat for **UDP 4900** or **TCP 2031**.

This will allow thin clients to use port 4900 to download the firmware and allow the thin client to use port 2031 to download the configuration but will keep other ports closed on the firewall.
Local Security Policy – User Access Controls

You may need to go to the Local Security Policy and change the User Account Control: Behavior of the elevation prompt for administrators in Admin Approval Mode to Elevate without prompting for ThinManager to run properly.

Open the Local Security Policy by selecting the Start > Administrative Tools > Local Security Policy.

Highlight Local Policies > Security Options in the tree.

Browse to User Account Control: Behavior of the elevation prompt for administrators in Admin Approval Mode and change the setting to Elevate without prompting.

This may be needed to run ThinManager as a non-administrator.
## Command Prompt

Terminal Services has several commands that aid in managing the terminal server. Some useful ones are:

<table>
<thead>
<tr>
<th>Command</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>change logon</td>
<td>Temporarily disables logons to a Terminal Server</td>
</tr>
<tr>
<td>change port</td>
<td>Changes COM port mappings for MS-DOS program compatibility</td>
</tr>
<tr>
<td>change user /install</td>
<td>Puts the server into &quot;Install Mode&quot;</td>
</tr>
<tr>
<td>change user /execute</td>
<td>Removes the server from &quot;Install Mode&quot;</td>
</tr>
<tr>
<td>Ipconfig</td>
<td>Displays the IP addresses of the network card</td>
</tr>
<tr>
<td>Logoff</td>
<td>Logs off a user from a session and deletes the session from the server</td>
</tr>
<tr>
<td>net send username &quot;message&quot;</td>
<td>Sends a message to a user. <code>username</code> is the NT/2000 user name that the person or terminal is logged in as. <code>message</code> is the text of the message. Quotation marks are needed for any messages containing a space.</td>
</tr>
<tr>
<td>query process</td>
<td>Displays information about processes running on a Terminal server</td>
</tr>
<tr>
<td>query session</td>
<td>Displays information about sessions on a Terminal server</td>
</tr>
<tr>
<td>query termserver</td>
<td>Displays a list of all Terminal servers on the network</td>
</tr>
<tr>
<td>query user</td>
<td>Displays information about user sessions on a Terminal server</td>
</tr>
<tr>
<td>reset session</td>
<td>Resets a session to known initial values</td>
</tr>
<tr>
<td>Shadow</td>
<td>Monitors another user's session</td>
</tr>
<tr>
<td>Tsdiscon</td>
<td>Disconnects a client from a terminal server session</td>
</tr>
<tr>
<td>Tsshutdown</td>
<td>Shuts down the terminal server in an orderly manner</td>
</tr>
</tbody>
</table>

See the Windows online help for additional commands and parameters.

Other useful commands include:

<table>
<thead>
<tr>
<th>Command</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>gpedit.msc</td>
<td>Launches the Group Policy Editor</td>
</tr>
<tr>
<td>tscc.msc</td>
<td>Launches the Terminal Services Configuration Console</td>
</tr>
<tr>
<td>tsadmin</td>
<td>Launches the Terminal Services Manager</td>
</tr>
</tbody>
</table>
## Alternative Terminal Keystrokes

Certain keystrokes are not available in a terminal session. Microsoft has provided these alternatives.

<table>
<thead>
<tr>
<th>Keystroke</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALT+PAGE UP</td>
<td>Switches between programs from left to right.</td>
</tr>
<tr>
<td>ALT+PAGE DOWN</td>
<td>Switches between programs from right to left.</td>
</tr>
<tr>
<td>ALT+INSERT</td>
<td>Cycles through the programs in the order they were started.</td>
</tr>
<tr>
<td>ALT+HOME</td>
<td>Displays the Start menu.</td>
</tr>
<tr>
<td>CTRL+ALT+BREAK</td>
<td>Switches the client between a window and full screen.</td>
</tr>
<tr>
<td>CTRL+ALT+END</td>
<td>Brings up the Windows 2000 Security dialog box.</td>
</tr>
<tr>
<td>ALT+DELETE</td>
<td>Displays the Windows menu.</td>
</tr>
<tr>
<td>CTRL+ALT+Minus (-) symbol on the numeric keypad</td>
<td>Places a snapshot of the active window, within the client, on the Terminal server clipboard (provides the same functionality as pressing PrintScrn on a local computer.)</td>
</tr>
<tr>
<td>CTRL+ALT+Plus (+) symbol on the numeric keypad</td>
<td>Places a snapshot of the entire client window area on the Terminal server clipboard (provides the same functionality as pressing ALT+PrintScrn on a local computer.)</td>
</tr>
</tbody>
</table>
DHCP Server Setup

Dynamic Host Configuration Protocol (DHCP) is a program that assigns IP addresses to devices on a network. DHCP server can be used to provide IP addresses to ThinManager Ready thin clients. It can also be configured to point the thin clients to the ThinManager Servers with Option 066, Boot Server Host Name.

Scope Options

The DHCP Server needs Option 066 configured before it will provide the ThinManager Server IP address that the terminal needs to boot.

The Boot Server Host Name, Option 066, assigns a ThinManager server to the terminal.

Open the Scope Options dialog box by highlighting the Scope Option folder in the tree pane of the Computer Management Console under the Services and Application > DHCP folder and selecting Action > Configure Options.

Scroll through the list window and check the Option 066 check box.

Enter the IP address of the desired ThinManager server in the String Value field.

The DHCP Server can issue the IP address for a Primary ThinManager Server and a Secondary ThinManager Server by listing the IP addresses of both, separated with a space.
DHCP Properties

The DHCP Server can be configured to check for duplicate IP addresses before issuing a new address. This is a good feature to use.

Highlight DHCP under Services and Applications in the Computer Management tree and select Action > Properties, or right-click on DHCP and select Properties. The DHCP Properties window will launch.

DHCP Properties – Advanced Tab

Select the Advanced tab. Replace the zero in the Conflict detection attempts field with an integer. This will prompt the DHCP Server to check for duplicate IP addresses before assigning an IP address.

Select OK when finished.
Group Policy

Windows has a number of features that can be allowed or prevented with a Group Policy. Group Policy is configured in the Group Policy Object Editor snap-in to the Microsoft Management Console.

Access the Group Policy Editor by typing `gpedit.msc` at a command prompt to launch the Microsoft Group Policy Editor.

Expanding the tree will show Group Policy settings that can affect the terminal server experience.

Please refer to Microsoft documentation for information on using these features.
